## Sample Solved Problems in SFD and BMD

Below are illustrative examples of common problems with detailed solutions to help reinforce learning.

### Problem 1: Heat Transfer in Structural Steel during a Fire

Question:

Calculate the temperature rise in a steel beam exposed to a fire for 30 minutes, assuming the fire temperature is 1000°C, and the heat transfer coefficient is 25 W/m<sup>2</sup>°C. The beam surface area is 0.2 m<sup>2</sup>, and the mass of the steel is 50 kg with a specific heat capacity of 0.49 kJ/kg°C.

Solution:

Step 1: Calculate the total heat transferred (Q)

$$Q = h \times A \times \Delta T \times \text{time}$$

But since the fire temperature is constant, and the heat transfer is primarily via convection:

$$Q = h \times A \times (T_{\text{fire}} - T_{\text{initial}}) \times \text{time}$$

Convert time to seconds:

$$30 \text{ minutes} = 1800 \text{ seconds}$$

Step 2: Calculate heat transfer (Q)

$$Q = 25 \text{ W/m}^2\text{°C} \times 0.2 \text{ m}^2 \times (1000\text{°C} - T_{\text{initial}}) \times 1800 \text{ s}$$

Assuming initial temperature  $T_{\text{initial}}$  is room temperature (~25°C):

$$Q = 25 \times 0.2 \times (1000 - 25) \times 1800$$

$$Q = 25 \times 0.2 \times 975 \times 1800$$

Calculate:

$$25 \times 0.2 = 5$$

$$Q = 5 \times 975 \times 1800 = 5 \times 1,755,000 = 8,775,000 \text{ Joules}$$

Step 3: Calculate temperature rise ( $\Delta T$ )

$$Q = m \times c \times \Delta T$$

$$\Delta T = Q / (m \times c)$$

$$\text{Convert } c \text{ to J/kg°C: } 0.49 \text{ kJ/kg°C} = 490 \text{ J/kg°C}$$

Now,

$$\Delta T = 8,775,000 / (50 \times 490)$$

$$= 8,775,000 / 24,500$$

$$\approx 358.37^{\circ}\text{C}$$

Step 4: Find final temperature

$$T_{\text{final}} = T_{\text{initial}} + \Delta T = 25^{\circ}\text{C} + 358.37^{\circ}\text{C} \approx 383.37^{\circ}\text{C}$$

Answer:

The steel beam's temperature rises approximately to  $383^{\circ}\text{C}$  after 30 minutes of fire exposure.

## Problem 2: Selecting Fire-Resistant Material for Structural Beams

Question:

Design a fire-resistant concrete mix for beams expected to withstand 2 hours of fire exposure. The concrete should maintain structural integrity at high temperatures. What key considerations should be taken into account?

Solution:

Step 1: Material properties

- Use of high-temperature resistant aggregates (e.g., lightweight or mineral aggregates)
- Incorporation of supplementary cementitious materials like fly ash or silica fumes to improve thermal stability and reduce porosity

Step 2: Mix design parameters

- Increase cement content slightly to enhance strength at high temperatures
- Use of fibers (e.g., steel or polypropylene) to improve ductility and crack resistance

Step 3: Thermal considerations

- Ensure low thermal conductivity to delay heat penetration
- Add insulation layers if necessary

#### Step 4: Testing and validation

- Conduct fire resistance tests in accordance with standards (e.g., ASTM E119)
- Adjust mix based on test results to optimize fire resistance

#### Key considerations:

- Material composition and gradation
- Curing methods to enhance durability
- Structural design to avoid stress concentrations

#### Answer:

A fire-resistant concrete mix for beams involves selecting high-temperature resistant aggregates, incorporating supplementary cementitious materials, optimizing the mix for low thermal conductivity, and validating through standardized fire testing. Proper design ensures the beams maintain structural integrity for at least 2 hours under fire conditions.

## SFD BMD Solved Problems: A Comprehensive Guide for Structural Analysis Enthusiasts

Structural analysis forms the backbone of civil engineering, ensuring that structures are safe, stable, and economical. Among the various tools and methods used for analysis, SFD BMD solved problems?Shear Force Diagrams (SFD) and Bending Moment Diagrams (BMD)?play a pivotal role in understanding how loads affect beams and other structural elements. This comprehensive guide aims to delve deeply into the concept, methodology, and practical application of solved problems related to SFD and BMD, providing learners and practitioners with clarity and confidence.

## Understanding Shear Force and Bending Moment Diagrams

Before exploring solved problems, it's essential to grasp the fundamental concepts of shear force and bending moment.

### What is Shear Force?

- Definition: Shear force at a section of a beam is the internal force that acts parallel to the cross-section, resisting the sliding of one part of the beam relative to the other.
- Significance: Shear forces influence the design of beams, especially in determining the shear capacity and potential failure points.
- Units: Typically measured in Newtons (N) or kiloNewtons (kN).

### What is Bending Moment?

- Definition: Bending moment at a section is the internal moment that causes the beam to bend or flex.
- Significance: It helps in understanding the maximum bending stresses and designing for flexural strength.
- Units: Also measured in  $\text{N}\cdot\text{m}$  or  $\text{kN}\cdot\text{m}$ .

## Relationship Between Load, Shear Force, and Bending Moment

- The shear force diagram is the integral (area under the load diagram) of the load distribution.
- The bending moment diagram is the integral of the shear force diagram.
- Mathematically:
- $\frac{dV}{dx} = -w(x)$
- $\frac{dM}{dx} = V(x)$

where  $w(x)$  is the load intensity at a point  $x$ .

## Importance of Solved Problems in SFD and BMD

Solving problems systematically enhances understanding of structural behavior, helps in verifying theoretical concepts, and prepares engineers for real-world applications.

Key reasons to study solved problems include:

- Developing problem-solving skills
- Understanding step-by-step procedures
- Recognizing common patterns and pitfalls
- Building confidence in applying concepts to complex scenarios
- Preparing for exams and professional practice

## Step-by-Step Approach to Solving SFD and BMD Problems

A structured methodology ensures accuracy and efficiency.

### 1. Draw the Structural Diagram

- Sketch the beam with supports, loads, and dimensions.
- Indicate the type of supports (fixed, roller, hinge) and load types (point loads, uniformly distributed loads, varying loads).

### 2. Calculate Support Reactions

- Apply equilibrium equations:
- Sum of vertical forces = 0

- Sum of moments about a point = 0
- Use these reactions as boundary conditions.

### 3. Draw the Load Diagram

- Represent point loads as vertical arrows.
- Represent distributed loads as shaded areas or spanning segments.

### 4. Construct Shear Force Diagram (SFD)

- Begin from one support, typically the left end.
- Move along the beam, accounting for loads and reactions:
- At each load application point, update shear force.
- Between loads, shear force remains constant.
- Mark points where shear force jumps (discontinuities).

### 5. Construct Bending Moment Diagram (BMD)

- Use the shear force diagram:
- The bending moment at a section equals the area under the shear force diagram from the start point to that section.
- Alternatively, integrate shear force:
- $M(x) = M_{\text{start}} + \int V(x) dx$
- Identify maximum and minimum moments to determine critical points.

### 6. Interpret Results

- Locate maximum shear force and bending moment.
- Check for points of zero shear (possible points of maximum or minimum moment).
- Verify the shape and consistency of the diagrams.

## Common Types of Problems and Their Solutions

Understanding diverse problem types equips engineers to handle various real-world situations effectively.

### 1. Simply Supported Beam with Point Loads

- Scenario: A beam simply supported at both ends with multiple point loads.
- Key Steps:
  - Find reactions using equilibrium.
  - Construct shear force diagram: starting from one support, decrement shear at each load.
  - Construct bending moment diagram based on shear force: maximum at points where shear crosses zero.

## 2. Simply Supported Beam with Uniform Distributed Load (UDL)

- Scenario: A beam with a uniformly distributed load along its span.
- Key Steps:
  - Compute reactions considering total load  $(w \times L)$ .
  - Shear force decreases linearly from support to mid-span.
  - Bending moment follows a quadratic profile, maximum at mid-span.

## 3. Beams with Varying Loads and Multiple Supports

- Scenario: Complex loadings including point loads, UDLs, and varying loads over different segments.
- Approach:
  - Break the beam into segments.
  - Calculate reactions at supports.
  - Use piecewise calculations to build SFD and BMD.

## 4. Cantilever Beams

- Scenario: Fixed support with point or distributed loads.
- Note: Reactions include a moment at the fixed support.
- Analysis: Similar to simply supported beams but with boundary conditions at the fixed end.

## Practical Examples and Solved Problems

To illustrate, let's consider a typical problem:

Example: A simply supported beam of length 6 m carries a point load of 10 kN at 2 m from the left support and a UDL of 2 kN/m over the entire span.

Solution Steps:

- Calculate support reactions:

- Total load:

- Point load = 10 kN at 2 m.

- UDL =  $(2 \times 6 = 12 \text{ kN})$ .

- Sum of vertical forces:

-  $(R_A + R_B = 10 + 12 = 22 \text{ kN})$ .

- Moment about A:

-  $(R_B \times 6 = 10 \times 2 + 12 \times 3)$ .

-  $(R_B \times 6 = 20 + 36 = 56)$ .

-  $(R_B = \frac{56}{6} \approx 9.33 \text{ kN})$ .

- Reaction at A:

-  $(R_A = 22 - R_B \approx 12.67 \text{ kN})$ .

- Construct SFD:

- From A (0 m): shear starts at  $(+12.67) \text{ kN}$ .

- At 2 m: shear drops by 10 kN, shear =  $(12.67 - 10 = 2.67) \text{ kN}$ .

- Over the rest of the span, shear decreases linearly due to UDL:  $(2 \text{ kN/m} \times 4 \text{ m}) = 8 \text{ kN}$ .

- At 6 m: shear =  $(2.67 - 8 = -5.33 \text{ kN})$ .

- Construct BMD:

- Moment at supports:

- At A: zero.

- Max bending moment typically occurs where shear crosses zero:

- Shear becomes zero somewhere between 2 m and 4 m.

- Calculate maximum moment using area under shear diagram or directly:

- For example, at mid-span, approximate maximum bending moment.

- Results:

- Maximum bending moment occurs near the center.

- Critical points identified for reinforcement design.
