- Review answers if time permits

Sample Problems and Solutions from November 2013 Paper

Providing concrete examples helps illustrate the application of concepts and strategies.

Example 1: Simplify and Solve

Question: Simplify $\frac{3x^2 - 2x - 8}{x - 2}$. For which values of (x) is the expression defined?

Solution:

- Factor numerator: $(3x^2 - 2x - 8)$

Find factors:

[

$$3x^2 - 2x - 8 = (3x + 2)(x - 4)$$

]

- Rewrite expression:

[

$$\frac{(3x + 2)(x - 4)}{x - 2}$$

]

- Since numerator and denominator don't share common factors, the expression cannot be simplified further.

- The expression is undefined when denominator is zero:

\[

$$x - 2 = 0 \rightarrow x = 2$$

\]

Answer: The simplified form is $\frac{(3x + 2)(x - 4)}{x - 2}$, undefined at $(x = 2)$.

Example 2: Coordinate Geometry

Question: Find the equation of the line passing through $(1, 2)$ and $(3, 8)$.

Solution:

- Calculate gradient:

\[

$$m = \frac{8 - 2}{3 - 1} = \frac{6}{2} = 3$$

\]

- Use point-slope form:

\[

$$y - y_1 = m(x - x_1)$$

\]

Using point $(1, 2)$:

\[

$$y - 2 = 3(x - 1) \rightarrow y - 2 = 3x - 3$$

\]

- Simplify:

\[

$$y = 3x - 1$$

\]

Answer: The equation of the line is $(y = 3x - 1)$.

Example 3: Sequence Calculation

Question: Find the 10th term of an arithmetic sequence where the first term is 5 and the common difference is 3.
