Understanding ReactJS: A Foundation

Before diving into specific questions, it's important to grasp the fundamentals of ReactJS. React is an open-source JavaScript library maintained by Facebook, designed for creating reusable UI components. Its core features include virtual DOM, JSX syntax, component-based architecture, and unidirectional data flow.

Top 50 ReactJS Interview Questions and Answers

- What is ReactJS?

ReactJS is a JavaScript library used for building user interfaces, especially single-page applications, by creating reusable UI components. It simplifies the process of building interactive interfaces through a declarative programming model.

- What are the key features of ReactJS?

- Component-Based Architecture: UI is divided into independent, reusable components.
- Virtual DOM: React uses a virtual DOM to optimize rendering and improve performance.
- JSX: JavaScript XML allows writing HTML-like syntax within JavaScript.
- Unidirectional Data Flow: Data flows in one direction, making data management predictable.
- Lifecycle Methods: Functions that allow you to hook into different phases of a component's lifecycle.

- What is JSX?

JSX (JavaScript XML) is a syntax extension for JavaScript that looks similar to HTML. It allows developers to write HTML-like code within JavaScript, which React then transforms into JavaScript objects for rendering.

- Explain the Virtual DOM and its benefits.

The Virtual DOM is a lightweight copy of the real DOM stored in memory. React updates this Virtual DOM first, compares it with the previous version (diffing process), and then efficiently updates only the changed parts in the real DOM. Benefits include improved performance and faster UI updates.

- What are React components?

React components are reusable, self-contained building blocks that define how a part of the UI appears and behaves. They can be functional or class-based.

- Differentiate between functional and class components.

Aspect	Functional Components	Class Components
Syntax	JavaScript functions	ES6 classes
State Management	Hooks (useState, useEffect)	<code>this.state` and <code>setState()</code></code>
Lifecycle Methods	Managed via Hooks (<code>useEffect</code>)	Built-in lifecycle methods (<code>componentDidMount</code> , etc.)
Simplicity	Simpler, less code	More verbose, suitable for complex logic

- What are React Hooks?

React Hooks are functions that allow functional components to have state and side effects. Introduced in React 16.8, hooks like `useState`, `useEffect`, `useContext`, and `useReducer` enable functional components to manage state and lifecycle.

- List some common React Hooks.
- `useState`: Adds state to functional components.
- `useEffect`: Handles side effects such as data fetching.
- `useContext`: Accesses context data.
- `useReducer`: Manages complex state logic.
- `useRef`: Creates a mutable ref object.

- How does data flow in React?

React follows a unidirectional data flow, meaning data flows from parent components to child components via props. Child components cannot directly modify parent data; instead, they communicate through callbacks.

- What is props in React?

Props (short for properties) are read-only attributes passed from parent to child components to customize or configure the child component's behavior or appearance.

ReactJS Lifecycle Methods and State Management

- Explain the React component lifecycle.

React class components have lifecycle methods that are invoked at specific points:

- Mounting: `constructor()`, `componentDidMount()`
- Updating: `shouldComponentUpdate()`, `componentDidUpdate()`
- Unmounting: `componentWillUnmount()`

Functional components manage lifecycle using `useEffect()` hook.

- How do you manage state in React?

State can be managed using:

- Class components with `this.state` and `setState()`.
- Functional components with the `useState()` hook.

- What is the purpose of `setState()`?

`setState()` updates the component's state and triggers a re-render to reflect the changes in the UI.

- How to pass data between components?

Data is passed from parent to child via props. For child-to-parent communication, callback functions are passed down as props, which children invoke to send data upward.

- What is Context API in React?

React Context API provides a way to pass data through the component tree without prop drilling. It is useful for global data like user authentication, theme, etc.

Handling Events and Forms in React

- How do you handle events in React?

React handles events using camelCase syntax, and event handlers are passed as functions:

```
```jsx
```

Click me

```
```
```

- How to manage forms in React?

Forms are managed by controlling input elements via React state. The `value` attribute is set from state, and `onChange` updates the state accordingly.

- What is controlled component?

A controlled component is a form element whose value is controlled by React state, enabling validation and dynamic input handling.

- What is an uncontrolled component?

Uncontrolled components manage their own state internally, using refs to access DOM elements.

Advanced React Concepts

- What is React Router?

React Router is a library for handling client-side routing in React applications, allowing navigation between different views without page reloads.

- How do you implement routing in React?

By using `<Route>`, `<Link>`, and `<NavLink>` components to define routes and navigation links.

- What is Redux?

Redux is a predictable state container for JavaScript applications, often used with React for managing complex state across the app.

- How does Redux work?

Redux uses a single store, actions to describe state changes, and reducers to update the state based on actions.

- Difference between Redux and React Context API?

- Redux: Suitable for complex state management, middleware support, dev tools.
- Context API: Simpler, ideal for passing down global data but not suited for complex state logic.

- What are Higher-Order Components (HOCs)?

HOCs are functions that take a component and return a new component, enhancing its functionality. Example: ``withRouter()``.

Additional Common Questions

- What is React Fiber?

React Fiber is a reconciliation algorithm that enables incremental rendering, improving responsiveness and enabling features like concurrency.

- What are keys in React lists?

Keys are unique identifiers assigned to list items to help React identify which items have changed, added, or removed.

- What is the difference between state and props?

- State: Mutable data managed within a component.
- Props: Immutable data passed from parent to child.

- How can you improve the performance of React apps?

- Use `React.memo` and `useMemo()`.
- Lazy load components.
- Avoid unnecessary re-renders.
