Electrostatics Problem: Electric Field due to a Continuous Charge Distribution

Problem Statement:

Calculate the electric field at a point (P) located 5 meters from a uniformly charged rod of length 10 meters, which carries a total charge of $20 \text{ } \mu\text{C}$. The rod lies along the x-axis from $(x = 0)$ to $(x = 10)$ meters. Assume the point (P) is located at $(0, 5)$ meters.

Solution Approach:

- Identify the charge distribution:

Since the charge is uniformly distributed, the linear charge density (λ) is:

[

$$\lambda = \frac{Q}{L} = \frac{20 \times 10^{-6} \text{ C}}{10 \text{ m}} = 2 \times 10^{-6} \text{ C/m}$$

]

- Set up the coordinate system:

Let the rod extend from $(x' = 0)$ to $(x' = 10 \text{ m})$.

Point (P) is at $(0, 5 \text{ m})$.

- Express the differential charge element:

A small element (dx') at position (x') has charge:

[

$$dq = \lambda dx'$$

]

- Calculate the differential electric field $(d\vec{E})$:

The electric field contribution at (P) due to (dq) is:

[

$$d\vec{E} = \frac{1}{4\pi\epsilon_0} \frac{dq}{r^2} \hat{r}$$

]

where (r) is the distance from (dq) to (P) , and $(\hat{r})$ is the unit vector pointing from (dq) to (P) .

The position of (dq) is $(x', 0)$, and (P) is at $(0, 5)$, so:

[

$$r = \sqrt{(x' - 0)^2 + (0 - 5)^2} = \sqrt{x'^2 + 25}$$

]

The vector from (dq) to (P) :

[

$$\vec{r} = (0 - x', 5 - 0) = (-x', 5)$$

]

The magnitude:

[

$$r = \sqrt{x'^2 + 25}$$

]

The unit vector $(\hat{r})$:

[

$$\hat{r} = \frac{\vec{r}}{r} = \left(\frac{-x'}{r}, \frac{5}{r} \right)$$

]

- Express the differential field components:

[

$$dE_x = \frac{1}{4\pi\epsilon_0} \frac{dq}{r^2} \times \frac{-x'}{r} = \frac{1}{4\pi\epsilon_0} \frac{dq}{r^3} (-x')$$

]

\[

$$dE_y = \frac{1}{4\pi\epsilon_0} \frac{dq}{r^2} \times \frac{5}{r} = \frac{1}{4\pi\epsilon_0} \frac{dq}{r^3} \quad (5)$$

\]

- Integrate over the length of the rod:

\[

$$E_x = \int_0^{10} dE_x = -\frac{\lambda}{4\pi\epsilon_0} \int_0^{10} \frac{x'}{(x'^2 + 25)^{3/2}} dx'$$

\]

\[

$$E_y = \frac{\lambda}{4\pi\epsilon_0} \int_0^{10} \frac{5}{(x'^2 + 25)^{3/2}} dx'$$

\]

- Perform the integrations:

Standard integrals yield:

- For (E_x) :

\[

$$\int \frac{x'}{(x'^2 + a^2)^{3/2}} dx' = -\frac{1}{\sqrt{x'^2 + a^2}}$$

\]

- For (E_y) :

\[

$$\int \frac{dx'}{(x'^2 + a^2)^{3/2}} = \frac{x'}{a^2 \sqrt{x'^2 + a^2}}$$

]

with $(a = 5 \text{ m})$.

Calculating:

[

$$E_x = -\frac{\lambda}{4\pi\epsilon_0} \left[-\frac{1}{\sqrt{x'^2 + 25}} \right]_0^{10} = \frac{\lambda}{4\pi\epsilon_0} \left(\frac{1}{\sqrt{10^2 + 25}} - \frac{1}{\sqrt{0 + 25}} \right)$$

]

[

$$E_x = \frac{2 \times 10^{-6}}{4\pi} \times 8.854 \times 10^{-12} \left(\frac{1}{\sqrt{125}} - \frac{1}{5} \right)$$

]

Similarly,

[

$$E_y = \frac{\lambda}{4\pi\epsilon_0} \times 5 \times \left[\frac{x'}{25 \sqrt{x'^2 + 25}} \right]_0^{10}$$

]

Calculate the bounds:

[

$$\frac{10}{25 \sqrt{125}} = \frac{10}{25 \times 11.1803} \approx \frac{10}{279.507} \approx 0.0358$$

]

At 0:

$$\frac{0}{25 \times 5} = 0$$

$$\frac{0}{25 \times 5} = 0$$

Thus:

$$\frac{0}{25 \times 5} = 0$$

$$E_y = \frac{2 \times 10^{-6}}{4\pi \times 8.854 \times 10^{-12}} \times 5 \times 0.0358$$

$$\frac{0}{25 \times 5} = 0$$

Final numerical evaluation yields the magnitude and direction of the electric field at (P) .
