```

Note: You might need to utilize specialized MATLAB toolboxes or third-party functions such as "SegyMAT" for SEG-Y files.

2. Data Visualization and Inspection

Visual inspection helps identify noise, anomalies, or data quality issues.

```
```matlab

imagesc(rawData);

colormap(gray);

colorbar;

title('Raw Seismic Data');

xlabel('Trace Number');

ylabel('Sample Number');
```

...

### 3. Data Conditioning

Preprocessing steps improve data quality and prepare it for further analysis:

- **Denoising:** Removing random noise using filters such as bandpass, median, or wavelet denoising.
- **Deconvolution:** Enhancing resolution by compressing the seismic wavelet.
- **Gain Correction:** Amplifying signals to compensate for amplitude decay.
- **Trace Alignment:** Correcting for timing discrepancies across traces.

Example: Applying a bandpass filter

```
```matlab
```

```
fs = 1000; % sampling frequency in Hz
```

```
lowCut = 10; % low cutoff frequency
```

```
highCut = 100; % high cutoff frequency
```

```
[b, a] = butter(4, [lowCut, highCut]/(fs/2), 'bandpass');
```

```
filteredData = filtfilt(b, a, rawData)';
```

...

4. Signal Processing Techniques

This stage involves various processing algorithms to enhance interpretability:

a. Fourier Transform

Transforms signals from time to frequency domain, aiding in noise identification.

```
```matlab
```

```
n = size(filteredData,2);
```

```
f = (0:n-1)(fs/n);

Y = fft(filteredData,[],2);

magnitudeSpectrum = abs(Y);

...
```

## b. Wavelet Analysis

Provides multi-resolution analysis, ideal for denoising and feature extraction.

```
```matlab  
  
[cwtCoeffs, frequencies] = cwt(filteredData, 'amor', fs);  
  
...
```

c. Migration and Reflection Imaging

Imaging techniques such as Kirchhoff migration can be implemented to position seismic events accurately.

5. Data Interpretation and Visualization

After processing, visualization techniques help interpret the subsurface features:

Example: Displaying processed seismic sections

```
```matlab  

imagesc(processedData);

colormap(gray);

colorbar;

title('Processed Seismic Section');

xlabel('Trace Number');
```

```
ylabel('Time (ms)');
```

```
...
```

This collaborative approach ensured that UBC 94 reflected current scientific understanding and practical engineering considerations.

## Technical Foundations of UBC 94 Seismic Design

### Seismic Hazard Analysis

At the core of UBC 94's seismic provisions is a rigorous hazard analysis framework, which estimates the likelihood of seismic events at specific locations. This involves:

- Seismic hazard maps that depict ground motion parameters such as peak ground acceleration (PGA)
- Site-specific assessments considering soil types, topography, and geological factors
- Use of probabilistic seismic hazard analysis (PSHA) to quantify the probability of exceedance of certain ground motion levels over a building's lifespan

This foundation informs the seismic design category assigned to each site, influencing the stringency of design criteria.

### Seismic Design Categories (SDCs)

UBC 94 classifies buildings into different Seismic Design Categories (SDCs), ranging from A (least critical) to F (most critical), based on:

- Seismic hazard level
- Occupancy importance
- Building use and function

These categories dictate the minimum requirements for structural design, detailing, and materials, ensuring that critical facilities receive higher levels of seismic resistance.

### Design Ground Motion and Load Calculations

UBC 94 specifies the calculation of design base shear ( $V$ ), which represents the lateral force a

structure must resist during an earthquake. The process involves:

- Determining the Seismic Design Category
- Calculating the spectral response acceleration ( $S_s$  and  $S_1$  values)
- Applying the response spectrum method to compute the fundamental period ( $T$ ) of the structure
- Using the formula  $V = C_s \times W$ , where  $C_s$  is the seismic response coefficient and  $W$  is the building's weight

This approach ensures that structures are designed to withstand forces consistent with the seismic hazard at their location.

## Structural System Requirements

UBC 94 emphasizes the importance of selecting appropriate structural systems based on the building's seismic risk. Key requirements include:

- Use of ductile materials like reinforced concrete and steel
- Detailing practices that allow energy dissipation and prevent brittle failures
- Incorporation of seismic joints and reinforcement to accommodate deformations
- Specific design considerations for non-structural components and essential facilities

## Implementation and Practical Aspects

- Variability in local soil and geological conditions that complicate hazard assessments
- The need for specialized knowledge in seismic design among engineers and contractors
- Potential conflicts between seismic requirements and other design constraints such as aesthetics or cost
- Transitioning from prescriptive to performance-based design approaches

## Case Studies and Performance

Notably, the adoption of the International Building Code (IBC) and the development of performance-based seismic design have introduced more flexible and scientifically robust frameworks. UBC 94 has been largely superseded in many regions, but its principles remain foundational.

### Criticisms and Limitations

Some critiques of UBC 94 include:

- Conservative assumptions leading to higher costs
- Challenges in accurately assessing local seismic hazards
